

Acoustics (VTAN01) – Building Acoustics (1:Sound Insulation)

NIKOLAS VARDAXIS DIVISION OF ENGINEERING ACOUSTICS, LUND UNIVERSITY

RECAP from previous lectures

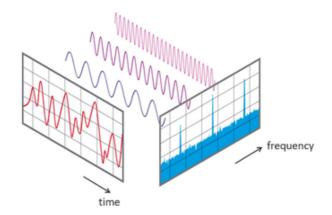

- Time & frequency domains
- Narrow band & Octaves & 1/3-octave
- Sound pressure level (SPL / L_p)

$$L_{p} = 10 \log \left(\frac{\tilde{p}^{2}}{p_{\text{ref}}^{2}}\right) = 20 \log \left(\frac{\tilde{p}}{p_{\text{ref}}}\right)$$

- Hand held (measurements)
- Sound intensity level (SIL / L_I)

 $L_{I} = 10 \log \left(\frac{I}{I_{0}}\right)$

- Plane/cylindrical/spherical prop.
- Sound power level (source property)

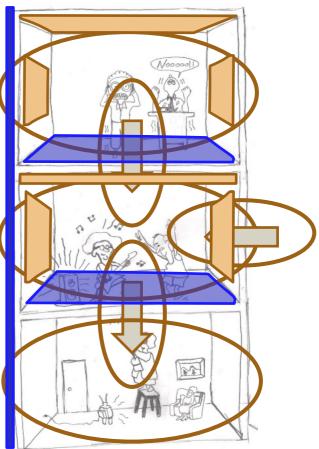

ISO Band numbers	Octave band center frequency	One-third octave band center frequencies
1	1.25 Hz	
2, 3, 4	2 Hz	1.6 Hz, 2 Hz , 2.5 Hz
5, 6, 7	4 Hz	3.15 Hz, 4 Hz , 5 Hz
8, 9, 10	8 Hz	6.3 Hz, 8 Hz , 10 Hz
11, 12, 13	16 Hz	12.5 Hz, 16 Hz , 20 Hz
14, 15, 16	31.5 Hz	25 Hz, 31.5 Hz , 40 Hz
17, 18, 19	63 Hz	50 Hz, 63 Hz , 80 Hz
20, 21, 22	125 Hz	100 Hz, 125 Hz , 160 Hz
23, 24, 25	250 Hz	200 Hz, 250 Hz , 315 Hz
26, 27, 28	500 Hz	400 Hz, 500 Hz , 630 Hz
29, 30, 31	1000 Hz	800 Hz, 1000 Hz , 1250 Hz
32, 33, 34	2000 Hz	1600 Hz, 2000 Hz , 2500 Hz
35, 36, 37	4000 Hz	3150 Hz, 4000 Hz , 5000 Hz
38, 39, 40	8000 Hz	6300 Hz, 8000 Hz , 10000 Hz
41, 42, 43	16000 Hz	12500 Hz, 1 6000 Hz , 20000 H

Isolate & Conditioning

Isolation → Building acoustics
 Prevent transmission
 » Improve "envelopes"

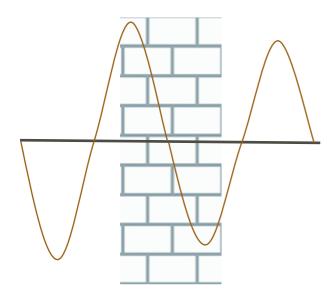

Conditioning → Room acoustics
 – Improve comfort
 » Room treatment

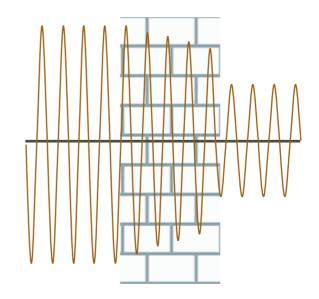

High & Low Frequencies

• Low frequency: long "stride" (wavelength)

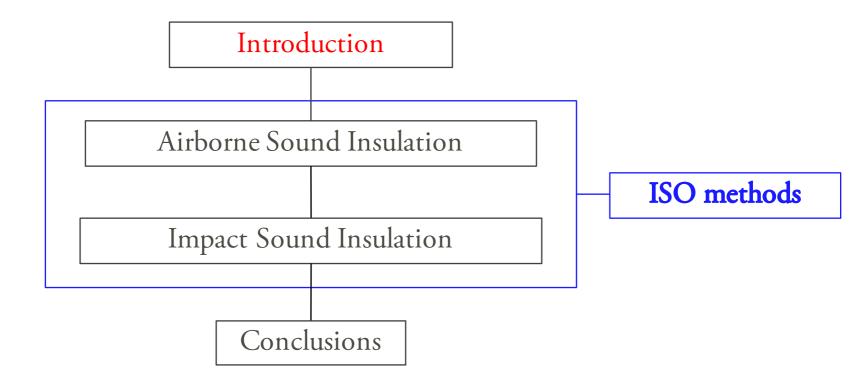

• High frequency: short "stride" (wavelength)

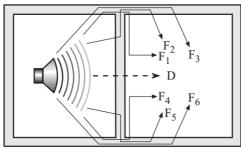

Outline

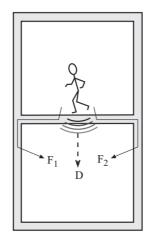

Introduction (I)

- Sound transmission
 - Airborne
 - Structure-borne
- Transmission paths
 - Direct transmission (D)
 - Flanking paths (F_i)

(a) Airborne sound transmission.

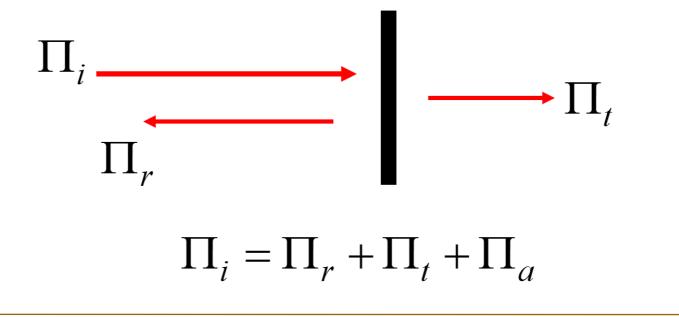

(b) Impact sound.

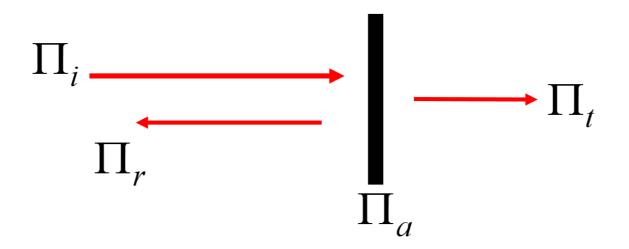

Introduction (II)

- Π_i Incident wave power
- Π_r Reflected wave power
- Π_t Transmitted wave power
- Π_a Power reduction due to absorption

Introduction (III)

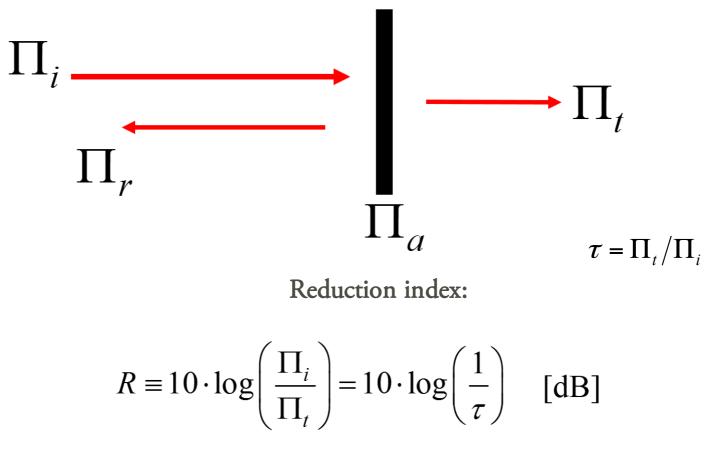

Transmission coefficient: $\tau = \Pi_t / \Pi_i$ [-]Absorption coefficient: $\alpha = \Pi_a / \Pi_i$ [-]Reflection coefficient: $\rho = \Pi_r / \Pi_i$ [-]

$$\tau + \rho + \alpha = 1$$

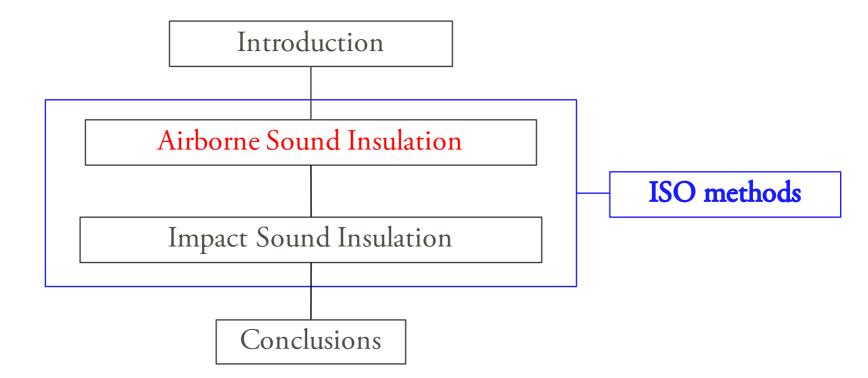

Introduction (IV)

Outline

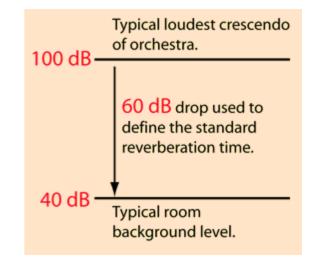

DEF: Reverberation time

- <u>Reverberation time</u>
 - Time for sound to decrease 60 dB from initial level
 - » "Clarity vs. Intensity" compromise
 - Not necessarily coincident with listener feeling
 - Why 60 dB?
 - Values dependent on ussage
 - » Ex: general auditorium: 1.5 2.5 sec.
 - Calculation (Sabine's law)

$$RT(f) = T_{60}(f) = 0.16 \frac{V}{A_{eff}(f)} = 0.16 \frac{V}{\sum_{i} \alpha_i(f) S_i}$$

V: room volume / A_{eff} : effective absorption area / α_i : individual absorption coefficients / S_i : surface of each element with α_i

 T_{20} / T_{30} ?

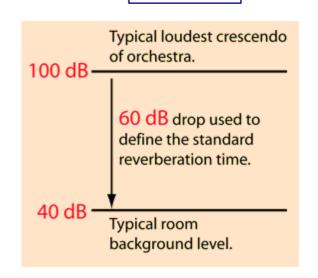

DEF: Reverberation time

- <u>Reverberation time</u>
 - Time for sound to decrease 60 dB from initial level
 - » "Clarity vs. Intensity" compromise
 - Not necessarily coincident with listener feeling
 - Why 60 dB?
 - Values dependent on ussage
 - » Ex: general auditorium: 1.5 2.5 sec.
 - Calculation (Sabine's law)

$$RT(f) = T_{60}(f) = 0.16 \frac{V}{A_{eff}(f)} = 0.16 \frac{V}{\sum_{i} \alpha_i(f) S_i}$$

V: room volume / A_{eff} : effective absorption area / α_i : individual absorption coefficients / S_i : surface of each element with α_i

 T_{20} / T_{30} ?

RT / T60

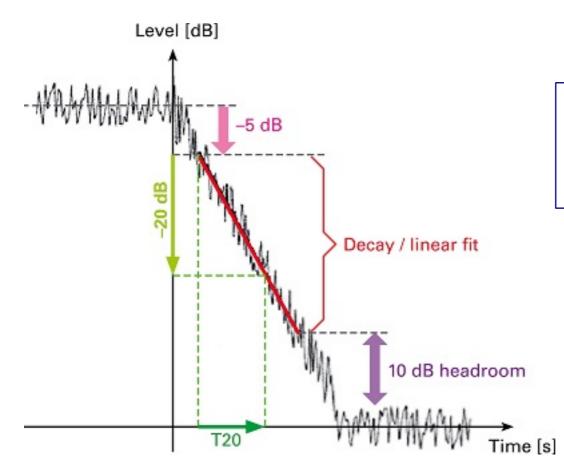

Reverberation time – Frequency dependence

Reverberation time – Alternatives of RT/T60

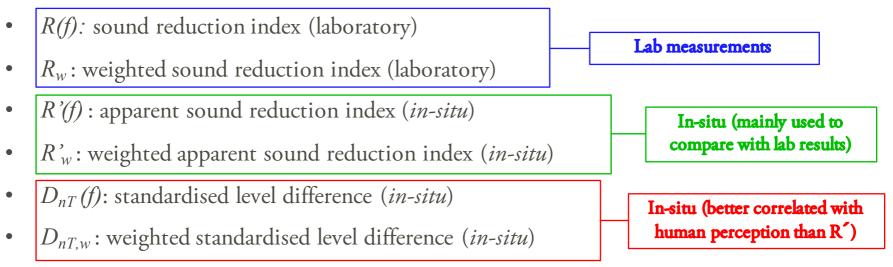

T20 or T30 calculating a 20 or 30 dB drop instead if there is not enough information in the impulse response.

Source: https://www.wikiwand.com/en/Reverberation

Nomenclature

- $C_{50-3150}$: spectrum adaptation term
- C_{tr} : spectrum adaptation term due to traffic noise

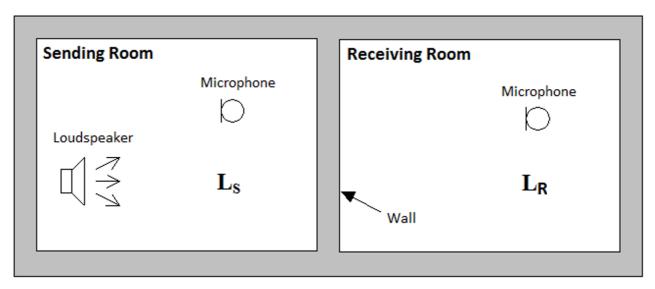

Statement of results: $R'_{w}(C_{50-3150}; C_{tr}) / R_{w}(C_{50-3150}; C_{tr}) / D_{nT,w}(C_{50-3150}; C_{tr})$

"Rule of thumb": Difference between lab and *in-situ* ~4 dB!

<u>NOTE:</u> There are more single-number indicators, but they are not included here to not make it even more complicated (see ISO 717-1:2013) <u>NOTE2:</u> "to normalise" means "to scale" with a reference area of 10 m², whereas when "standardising" a reference T₆₀ of 0.5 s is used <u>NOTE3:</u> In the course, for the sake of simplicity, D_{nT} will not be used, we will stick to *R* and *R*'. <u>NOTE4:</u> a prime (') next to R/R_w is used to distinguish between in-situ and lab measurements respectively.

Measurement sound reduction index (I)

 $L_S(f)$: SPL in the sending room [dB]

 $L_R(f)$: SPL in the receiving room [dB]

S: wall area [m²]

In practice, A(f) is calculated by measuring $T_{60}(f)$

NOTE: Loudspeaker and microphone positions are defined in the corresponding ISO standard.

Wall's reduction index [dB]

(= transmission loss):

$$R(f) = L_S(f) - L_R(f) + 10\log\left(\frac{S}{A(f)}\right)$$

Measurement sound reduction index (II)

• <u>Example of (lab) measured curve:</u>

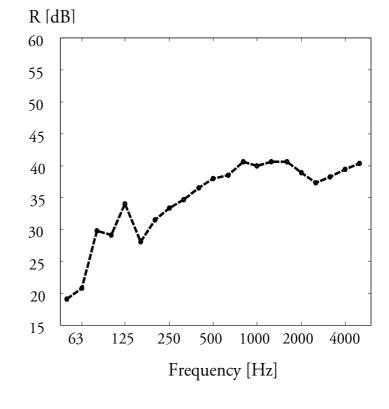

- High values \Rightarrow Better insulation \Rightarrow "Quieter"

$$R(f) = L_S(f) - L_R(f) + 10\log\left(\frac{S}{A(f)}\right)$$

<u>NOTE</u>: For in-situ measurements, the curve would be R'(f) instead, since it would account for flanking tranmission. In Sweden nowadays $D_{nT}(f)$ and $D_{nT,w}$ are used instead of R'(f) for in-situ measurements, to correlate better with human perception. In this course, however, we will stick to R(f) and R'(f) and thus R_w and R'_w .

$$D_{nT}(f) = L_S(f) - L_R(f) + 10\log\left(\frac{T_{60}(f)}{0.5}\right)$$

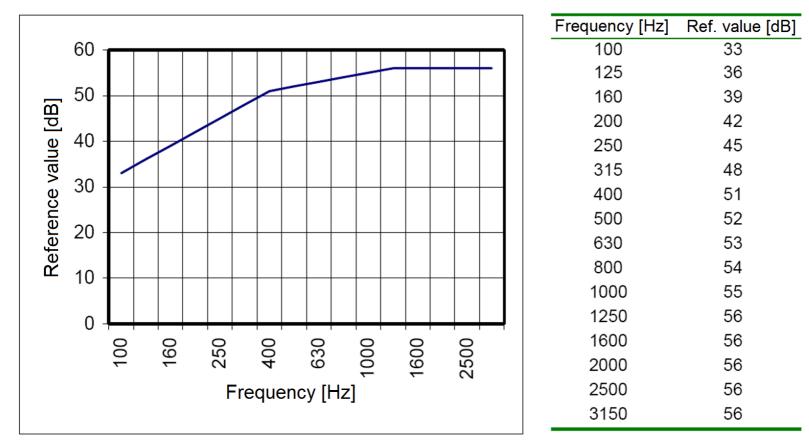

$$D_n(f): \text{ level difference}$$

ISO Evaluation of sound reduction index (I)

• Reference curve (ISO 717-1)

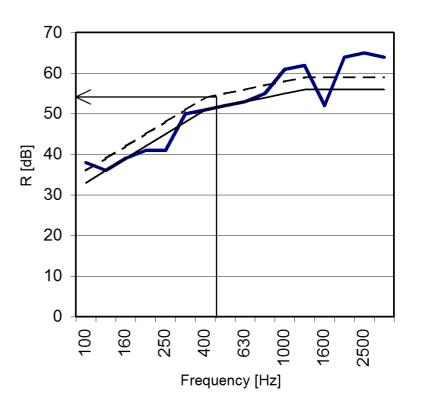

ISO Evaluation of sound reduction index (II)

"[...] the reference curve is shifted in steps of 1dB towards the measured one, until the sum of the unfavourable deviations is as large as possible, but not more than $32dB^*$ "

"[...] an unfavourable deviation at a particular frequency occurs when the result of measurements <u>is less</u> than the reference value"

"[...] the value, in dB, of the reference curve has at 500 Hz, after shifting in accordance with this procedure, is R_w "

Spectrum adaptation terms

- Defined in ISO 717-1: take into account different source spectra
 - C_{tr}: A-weighted urban traffic noise spectrum
 - C₅₀₋₃₁₅₀: frequency adaptation term

Frequency	Sound levels, <i>L</i> _{ij} , dB					
Hz		Spectrum No.1 to calculate			Spectrum No.2 to calculate	
	C ₅₀	-3150	C ₅₀₋₅₀₀₀ an	d C ₁₀₀₋₅₀₀₀	C _{tr} for any frequency	
	One-third octave	Octave	One-third octave	Octave	One-third octave	Octave
50 63 80	-40 -36 -33	-31	-41 -37 -34	-32	-25 -23 -21	-18
100 125 160	-29 -26 -23	-21	-30 -27 -24	-22	-20 -20 -18	-14
200 250 315	-21 -19 -17	-14	-22 -20 -18	-15	-16 -15 -14	-10
400 500 630	-15 -13 -12	-8	-16 -14 -13	-9	-13 -12 -11	-7
800 1 000 1 250	-11 -10 -9	-5	-12 -11 -10	-6	-9 -8 -9	-4
1 600 2 000 2 500	-9 -9 -9	-4	-10 -10 -10	-5	-10 -11 -13	-6
$3\ 150\ 4\ 000\ 5\ 000$	-9		-10 -10 -10	-5	-15 -16 -18	-11
NOTE All level	NOTE All levels are A weighted and the overall spectrum level is normalized to 0 dB.					

Table B.1 — Sound level spectra to calculate the adaptation terms for enlarged frequency range

<u>NOTE:</u> large negative values indicate poor airborne insulation at low frequencies

$$C_{tr} = -10 \log \left(\sum_{i} 10^{(Li-Ri)/10} \right) - R_{w}$$

$$C_{50-3150} = -10 \log \left(\sum_{i=1}^{19} 10^{(Li-Ri)/10} \right) - R_w$$

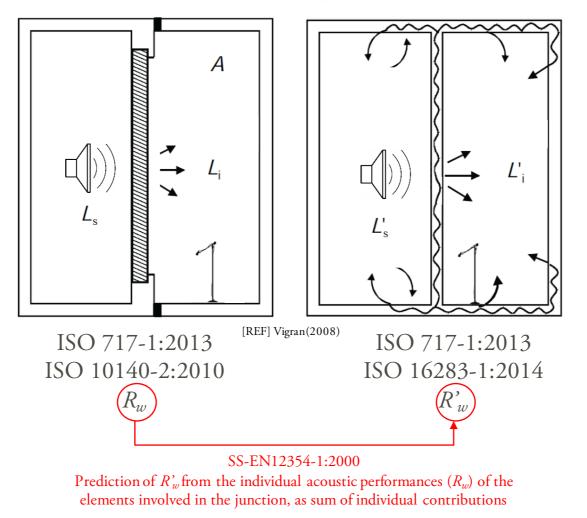

Statement of results:

- $R'_w(C_{50-3150}; C_{tr})$
- $R_w(C_{50-3150}; C_{tr})$

Remember...

... Laboratory vs. Field situation (flanking transmission comes into play)

Airborne sound insulation – example

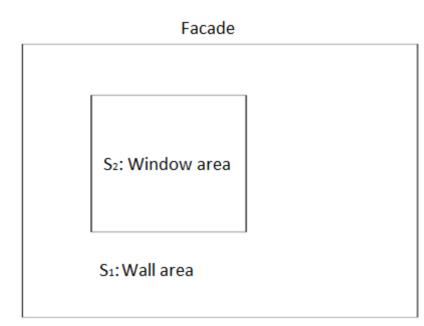

Upplevd störning vid olika luftljudsisolering

Vägt reduktions- tal i bygg- nad, R' _w	Normalt samtal	Högröstat	Skrik samtal	TV, radio, musikan- läggning (måttlig nivå)	Musik från större musik- anläggning i hemmet
40 dB	Kan uppfattas	Uppfattas	Hörs	Hörs	Hörs
44 dB	Kan höras	Kan uppfattas	Hörs	Hörs	Hörs
48 dB	Hörs inte	Kan höras	Kan höras	Hörs	Hörs
52 dB	Hörs inte	Kan höras	Kan höras	Kan höras	Hörs
56 dB	Hörs inte	Hörs inte	Kan höras	Kan höras	Hörs
60 dB	Hörs inte	Hörs inte	Hörs inte	Hörs inte	Kan höras

Figur 2:12. Exempel på hur störningar av olika aktiviteter kan upplevas beroende på aktuell luftljudsisolering. Störningskänsligheten liksom störningens karaktär kan dock variera utanför siffrorna i tabellen.

DEF: Combined reduction index

 $R_1, R_2 \dots$ individual reduction indeces *S*: total area, i.e. $S = S_1 + S_2 + \dots$

Combined reduction index:

$$R = -10 \log \left(\frac{1}{S} \left(S_1 10^{-R_1/10} + S_2 10^{-R_2/10} + \dots \right) \right)$$

Leakages

• Power of the opening (leakage)

$$\Pi_l = \Pi_i \cdot \frac{S_l}{S}$$

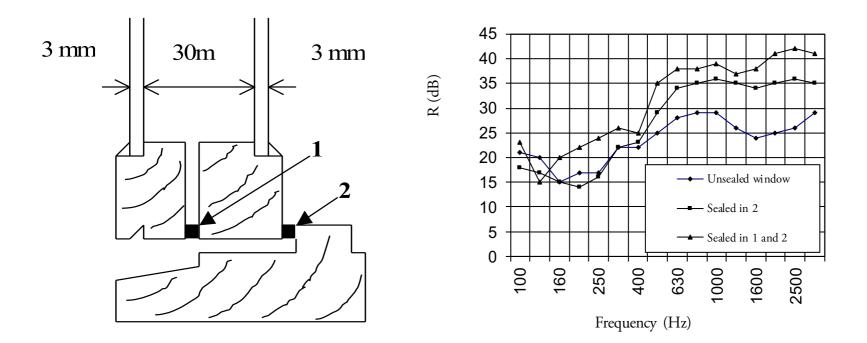

• The reduction index of the wall then becomes

$$R = -10 \cdot \log \left(\frac{\Pi_l + \Pi_t}{\Pi_i} \right) = -10 \cdot \log \left(\frac{\Pi_t}{\Pi_i} + \frac{S_l}{S} \right) \Longrightarrow$$
$$R_{withLeakage} = -10 \cdot \log \left(10^{-R/10} + \frac{S_l}{S} \right)$$

Example: influence of leakages

Sealing of windows is of crucial importance

NOTE: Example of leakage detection

1.- A 9 m² facade has a sound reduction index of 60 dB and has installed a 1 m² double window whose reduction index is 30 dB.

a) What does it mean that the material of the wall has a reduction index of 60dB? How much energy does the material let through?

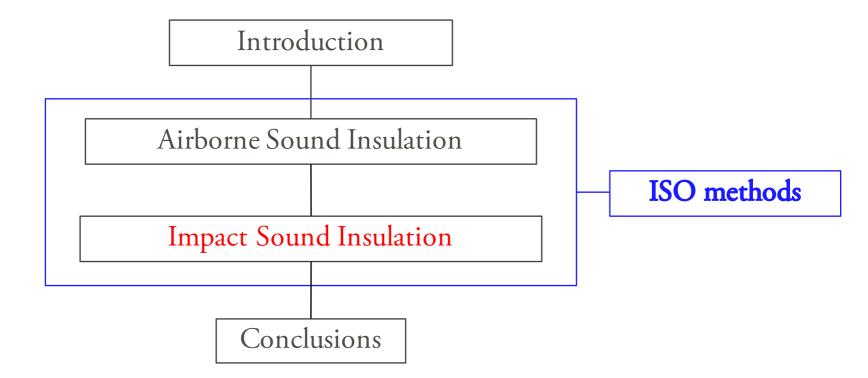

b) Calculate the combined sound reduction index of the facade

2.- What is the influence of a crack in a wall whose dimensions are 1 mm in width and 1 m in length in a wall of 2.40 m height and 4 m length? The sound reduction index of the wall without leakage is 50 dB.

How much the combined sound reduction index would be if the sound reduction index of the wall would increase up to 60 dB?

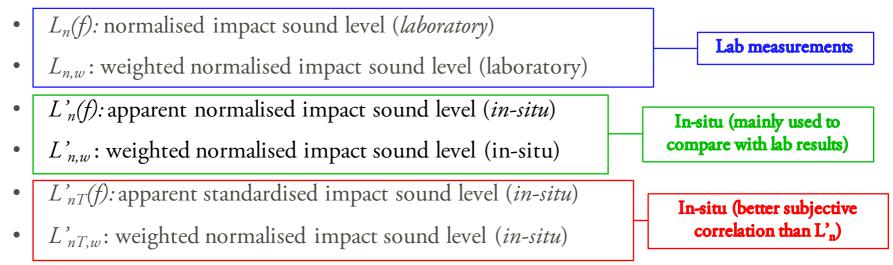

Outline

Nomenclature

• $C_{l,50-2500}$: spectrum adaptation term

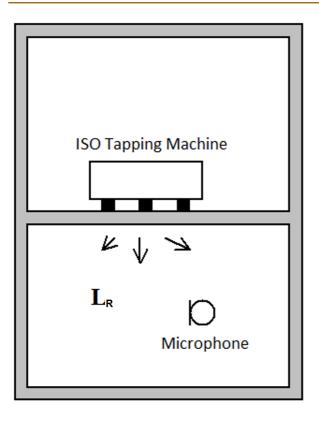

Statement of results: $L'_{nT,w}(C_{l,50-2500}) / L'_{n,w}(C_{l,50-2500}) / L_{n,w}(C_{l,50-2500})$

"Rule of thumb": Difference between lab and in-situ -4 dB!

<u>NOTE:</u> There are more single-number indicators, but they are not included here to not make it even more complicated (see ISO 717-2:2013) <u>NOTE2:</u> "to normalise" means "to scale" with a reference area of 10 m², whereas when "standardising" a reference T_{60} of 0.5 s is used <u>NOTE3:</u> L_{nT} provides a straightforward link to the subjective impression of impact sound insulation and is used as indicator in Sweden for field measurements. In the course, however, and to facilitate comparisons, we will stick to L_n and L'_n <u>NOTE4:</u> a prime (') next to an *L* indicator is used to distinguish between in-situ and lab measurements respectively

Measurement impact sound insulation (I)

- ISO Tapping Machine
 - Standardised: 1 hit per 0.1 s
 - 5 steel cylinders which alternatively hit the floor

Impact sound level:

$$L_n(f) = L_R(f) + 10\log\left(\frac{A(f)}{10}\right)$$

 $L_n(f)$: normalised impact sound level [dB] $L_R(f)$: SPL in the receiving room [dB] A(f): absorption area in the receiving room

NOTE: Tapping machine and microphone positions are defined in the pertinent ISO standard.

Measurement impact sound insulation (II)

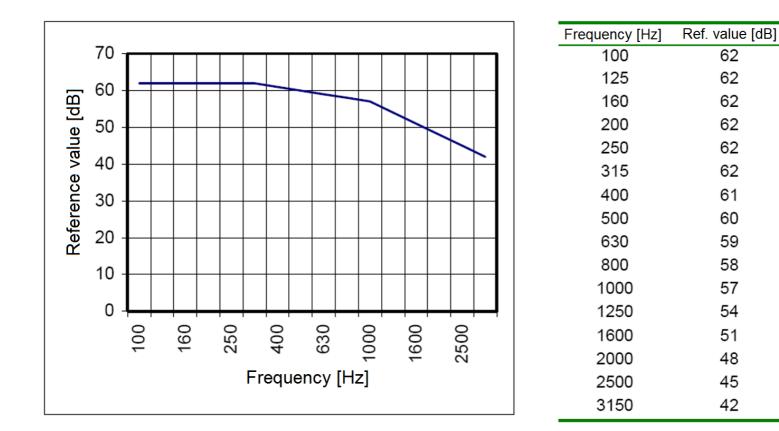

- Example of measured curve:
 - High values \Rightarrow Higher sound transmission \Rightarrow "Noisier"

ISO Evaluation of impact sound insulation (I)

• Reference curve (ISO 717-2)

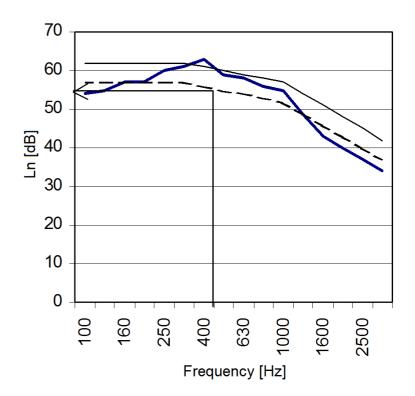

ISO Evaluation of impact sound insulation (II)

"[...] the reference curve is shifted in steps of 1dB towards the measured one, until the sum of the unfavourable deviations is as large as possible, but not more than $32dB^*$ "

"[...] an unfavourable deviation at a particular frequency occurs when the result of measurements <u>exceed</u> the reference value"

"[...] the value, in dB, of the reference curve has at 500 Hz, after shifting in accordance with this procedure, is $L_{n,w}$ "

*for measurements in 16 one-third-octave band. If measurements are performed in 5 octave bands, the sum should not exceed 10 dB.

Spectrum adaptation term

- Defined in ISO 717-2
 - $C_{I,50-2500}$: improves correlation with subjective response at low frequencies

$$C_{l,50-2500} = 10 \log \left(\sum_{50}^{2500} 10^{Ln,i(f)/10} \right) - 15 - L_{n,w}$$

Statement of results:
•
$$L'_{nT,w}(C_{l,50-2500})$$

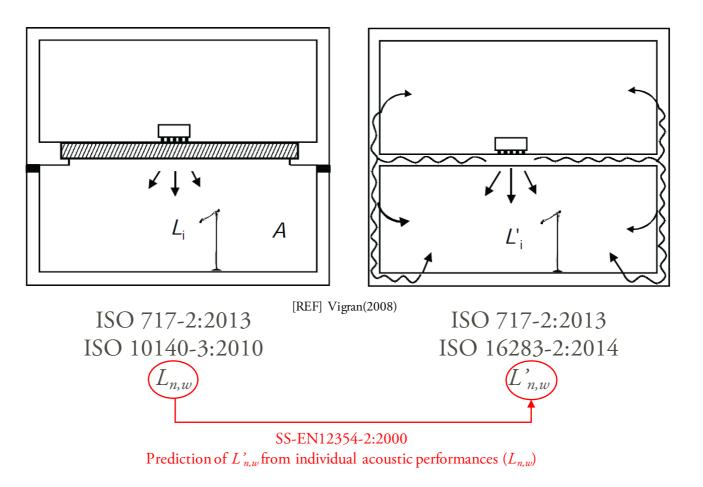

• $L'_{n,w}(C_{l,50-2500})$
• $L_{n,w}(C_{l,50-2500})$

NOTE: large positive values indicate poor impact insulation at low frequencies

Remember...

... Laboratory vs. Field situation (flanking transmission comes into play)

Sound classes (Sweden)

- Ljudklass A: the soundclass corresponds to very good acoustic conditions
- Ljudklass B: it comprises slightly better acoustic conditions than soundclass BBR. Certain individuals can still, in some cases, be disturbed. This sound class is the minimum if good living environment is requested
- Ljudklass BBR: this is the minimum requirements in Swedish buildings
- Ljudklass D: corresponds to noise conditions that are intended to be applied when sound class C cannot be achieved, e.g. in connection with some refurbishment works

BBR and SS 25267:2004

Requirements dwellings	A [dB]	B [dB]	BBR [dB]	(D) [dB]
Airborne sound insul.	61	57	53	49
Impact sound insul.	48	52	56	60
Installation noise	22/27	26/31	30/35	30/35
Traffic noise	22/37	26/41	30/45	34/49

*Installation and traffic noise have not been addressed in this lecture. For more information about how to measure and evaluate, see the correspondent ISO standards

Example from SS 25267:2004 – Sound class A

Tabell A1 – Lägsta tillåtna luftljudsisolering respektive högsta tillåtna stegljudsnivå och ljudtrycksnivå från installationer

Utrymme	Lägsta lu	uftljuds (dB)	isolering	ljuo	sta steg- dsnivå (dB)	Högsta ljudtrycks- nivå från installa- tioner (dB)	
	<i>R</i> ′ _{w,10m} ²	R´ _w	R' _w + C ₅₀₋₃₁₅₀	L´ _{n,w}	L' _{n,w} + C _{1,50-2500}	L_{pAeq}	L_{pAFmax}
Från utrymme utanför bostad till bostad	-	_	61	48	48	-	-
 dock från utrymme för närings- och serviceverksamhet samt gemensamhets- garage till bostad 	-	-	65	44	44	-	-
 dock från utrymme inom s	-	61 65 ^d	-	54	54	-	-
— dock från loftgång och trapphus/korridor	55 ^a	_	- 61	54	54	-	-
eller gemensam balkong/altan/ terrass till bostad	50 ^b						
	60 ^c						
 dock från hygienrum och förråd till bostad 	_	61	-	48 ^f	-	-	_
Inom bostad med fler än 2 rum till minst ett rum	44 ^g	-	-	64	-	-	-
l utrymme för sömn, vila och daglig samvaro	_	-	-	-	-	22 ^e	27
l övriga utrymmen	_	-	-	-	-	31	36

<u>NOTE:</u> Nowadays, there is a newer version of the standard, i.e. SS 25267:2015, which uses $D_{nT,w}$ and $L'_{nT,w}$ as single number indicators for field measurements. However and as previously stated, in the course we will stick to R'_w and $L_{n,w}$ to be able to compare in-situ and laboratory measurements in a more straightforward way.

The problem: lack of harmonisation (I)

Table 2

Overview of ISO 717 descriptors for evaluation of sound insulation in buildings.

ISO 717:1996 descriptors for evaluation of field sound insulation	Airborne sound insulation between rooms (ISO 717-1) ^b	Airborne sound insulation of facades ^a (ISO 717-1) ^b	Impact sound insulation between rooms (ISO 717-2) ^b
Basic descriptors (single-number quantities)	R' _w D_{n,w} D_{nT,w}	R'_{w} $D_{n,w}$ $D_{nT,w}$	$L'_{n,w}$ $L'_{nT,w}$
Spectrum adaptation terms (listed according to intended main applications)	None C C ₅₀₋₃₁₅₀ C ₁₀₀₋₅₀₀₀ C ₅₀₋₅₀₀₀	None C C _{tr} C ₅₀₋₃₁₅₀ C _{tr} , 50-3150 C ₁₀₀₋₅₀₀₀ C _{tr} , 100-5000 C ₅₀₋₅₀₀₀ C _{tr} , 50-5000	None C ₁ C _{1,50-2500}
Total number of descriptors	3 × 5 = 15	3 × 9 = 27	2 × 3 = 6

^a For facades, the complete indices for R'_w, D_{n,w}, D_{nT,w} are found in ISO 717.
 ^b For simplicity, only 1/3 octave quantities and C-terms are included in the table, although some countries allow 1/1 octave measurements for field check.

[REF] Rasmussen(2010)

The problem: lack of harmonisation (II)

Table 2

Airborne sound insulation between dwellings – Main requirements in 24 European countries. $^{\mathrm{a},\mathrm{b}}$
